

## Arbordeck anti slip deck boards

Arbordeck can provide you with products that meet the HSE's requirements for low-slip potential especially for commercial applications. These products are detailed on our website under anti-slip decking - click [here](#) to view these products. They have also been independently tested and these test results are available on request.

Whilst these products have been tested to meet and pass low-slip potential requirements, here are some points you must consider:-

1. Samples are available free of charge. Please ensure the product meets your specific requirements
2. It is important to ensure the boards are perpendicular to the direction the traffic moves in
3. If item 2 is not possible it is advisable to apply a coat of anti-slip paint to the timber element. Arbordeck can provide you with details of a suitable product
4. The deck board must be maintained regularly. For example this may include cleaning and the removal of algae. The time between maintenance must be ascertained by inspection. If anti-slip paint is applied (item 3) this must also be inspected regularly
5. Whilst the anti-slip inserts are very rugged and are likely to last many years no guarantee can be given on their length of effectiveness. This will be determined by usage, positioning and maintenance of the deck
6. Change in height elements are also worth considering with the likes of ramps and steps. Please visit the HSE's relevant web pages by clicking [here](#) for further details

If you have any questions please do not hesitate to contact Arbordeck for advice.
